## PHY.05548.04 - Basics of Materials and Polymer Physics

PHY.05548.04

10 CP

<b>Module label</b>	Basics of Materials and Polymer Physics
<b>Module code</b>	PHY.05548.04
<b>Semester of first implementation</b>	
<b>Module used in courses of study / semesters</b>	<ul style="list-style-type: none"> <li>• Polymer Materials Science (MA120 LP) (Master) &gt; Werkstofftechnik PolymerMaterialScMA120, Version of accreditation valid from WS 2014/15 &gt; Pflichtmodule</li> </ul>
<b>Responsible person for this module</b>	
<b>Further responsible persons</b>	Dr. Karsten Busse
<b>Prerequisites</b>	
<b>Skills to be acquired in this module</b>	

- The students learn about the central physical concepts in materials science.
- The students learn and train the necessary mathematical skills.
- They will be enabled in planning, performing and evaluating scientific experiments using modern instrumentation. This includes error estimation and analysis, recording, evaluating and presenting measurement data and writing a report.

### Module contents

This module covers basic theoretical details of polymer physics and physical chemistry. The lectures Introduction to Materials Physics (1) and Mathematical and Theoretical Concepts for Polymer Science (2) act as refresher or introductory courses for the main mathematical tools and solid state properties. The Lab course Basic Physics and Physical Chemistry Lab give the students the opportunity to get an idea for the handling of characterization experiments.

Lectures:

#### 1. Introduction to Materials Physics

- Atoms and bonds, crystal structures
- Structure analysis: microscopy techniques
- Basics of scattering (Bragg and crystal structures, wave equation, interference, structure factor)
- Phase transitions and phase diagrams
- Mechanical properties of solids
- Thermal, optical, magnetic, electric and dielectric properties

#### 2. Mathematical and Theoretical Concepts for Polymer Science

- Mathematical tools (linear algebra, trigonometry, complex numbers, Fourier transformation, delta function)
- Calculus: integration, differentiation, solving differential simple equations, applications to reaction kinetics and simple mechanical polymer models
- Statistics: distribution functions (mol. weight distributions, averages and moments), data treatment, error handling, linear regression
- Diffusion, Brownian motion and random walks; single-chain structure (Gaussian coil, radius of gyration)
- Basics of computer simulation techniques (interaction potentials, MD vs. MC)
- Introduction to quantum mechanics: Schrodinger equation, wave functions, particle in a box, harmonic oscillator, hydrogen atom, bonding

Lab course - Basic Physics and Physical Chemistry Lab:

9 experiments are performed. Each experiment consists of 4 hours lab time and private study of basics, writing the protocol and evaluating the experiment. The lab includes a tutorial experiment (radioactivity) that includes an introduction into the Origin software. The list of experiments is subject to changes. Current experiments are:

- Viscosity (falling ball viscometer)
- Humidity (dew point hygrometer)
- RLC oscillator (oscilloscope handling)

- Diffraction spectrometer (optical spectroscopy)
- Polarimeter and refractometer
- X-ray methods (spectrum of Mo tube, dosimetry)
- Vapor pressure and heat of vaporization (Clausius-Clapeyron)
- Freezing point depression
- Surface tension of liquids
- Solubility diagram of liquids (miscibility gap)

## CHE.05562.06 - Polymer Chemistry

CHE.05562.06

10 CP

<b>Module label</b>	Polymer Chemistry
<b>Module code</b>	CHE.05562.06
<b>Semester of first implementation</b>	
<b>Module used in courses of study / semesters</b>	<ul style="list-style-type: none"> <li>• Polymer Materials Science (MA120 LP) (Master) &gt; Werkstofftechnik PolymerMaterialScMA120, Version of accreditation valid from WS 2014/15 &gt; Pflichtmodule</li> </ul>
<b>Responsible person for this module</b>	
<b>Further responsible persons</b>	Prof. Dr. Wolfgang Binder
<b>Prerequisites</b>	
<b>Skills to be acquired in this module</b>	<ul style="list-style-type: none"> <li>• The students can apply their knowledge of basic concepts of polymer synthesis, terminology, synthesis, and characterization of composition and molar mass and distributions.</li> <li>• They deepen their knowledge of basic concepts of organic chemistry and polymer synthesis.</li> <li>• They understand and can qualify the role of synthetic polymers, including the necessities and their recycling strategies in view of modern societal needs and demands.</li> <li>• They learn to handle chemicals safely, basics of organic/polymer synthesis, preparation and purification techniques.</li> <li>• They can apply analytical methods for structural and materials applications.</li> <li>• They learn about writing of scientific reports.</li> </ul>

### Module contents

This module covers basic topics of polymer chemistry. The lecture Introduction to Macromolecules gives an overview on the general aspects of polymers and the lecture Organic Chemistry and Polymer Synthesis deepens the view on the basic synthesis and characterization methods. The lab course Basic Chemistry and Polymerization Lab allows the student to perform their first polymerization including all preparative steps like distillation of educts up to precipitation of products.

Lectures:

#### 1. Introduction to Macromolecules

- General introduction and history of polymer science
- General principles of polymer synthesis (step growth, chain growth, thermodynamics, kinetics, copolymerization, technical polymerizations, living polymerization)
- Reactions with polymers: isomerization, grafting, crosslinking
- Basics of polymer characterization: end-group titration/NMR, osmometry, viscosity, chromatography, mass spectrometry, Flory-Huggins theory, polymer additives
- Microphase-separated polymers: block copolymers, thin films, amphiphilic polymers in solvents, micelles, polymer crystallization, amorphous state
- Polymer materials and their bioprofiles (recycling, degradation, biological assessments)
- Applications of polymers in medicine, microelectronics, in society.

#### 2. Organic Chemistry and Polymer Synthesis

- Basic principles of organic chemistry
- Reaction mechanisms in organic chemistry
- Principles of homogeneous and heterogeneous catalysis
- Basics of solution-state NMR
- Free-radical and controlled free-radical polymerizations
- Living polymerizations, block copolymer synthesis
- Catalytic polymerizations (Ziegler/Natta, metallocene, ROMP)
- Polycondensation
- Network synthesis/thermosets

Lab course:

#### 1. Basic Chemistry and Polymerization Lab

- Basic operations (distillation, recrystallization, precipitation)
- Esterification, amidation, Free-radical polymerization
- Suspension/emulsion polymerization, Resin preparation (amino-, epoxy-resins)

## CHE.05565.02 - Master Thesis (M.Sc.)

CHE.05565.02 30 CP

**Module label** Master Thesis (M.Sc.)

**Module code** CHE.05565.02

**Semester of first implementation**

**Module used in courses of study / semesters**

- Polymer Materials Science (MA120 LP) (Master) > Werkstofftechnik PolymerMaterialScMA120, Version of accreditation valid from WS 2014/15 > Pflichtmodule

**Responsible person for this module**

**Further responsible persons** Hochschullehrer der Institute Physik oder Chemie bzw. des Fachbereiches der Hochschule Merseburg

**Prerequisites** at least 75 Credit Points (75 LP)

**Skills to be acquired in this module**

- The students will be enabled to carry out independent research.
- They will do literature studies and experimental work.
- Finally, the students write and defend their thesis.

**Module contents** This module covers the main part of the master course: The independent research work on a scientific or engineering based topic. The students must perform literature research, collect and evaluate experimental data, do their own research strategies, and finally present the results including a defense.

**Form of instruction** Independent supervised work (30 SWS)

**Languages of instruction** German, English

**Duration (semesters)** 1 Semester Semester

**Module frequency** jedes Semester

**Module capacity** unlimited

**Time of examination**

**Credit points** 30 CP

**Share on module final degree** Course 1: %.

**Share of module grade on the course of study's final grade** 1

Examination	Exam prerequisites	Type of examination

## CHE.05558.02 - Introduction to Polymer Research

CHE.05558.02 15 CP

**Module label** Introduction to Polymer Research

**Module code** CHE.05558.02

**Semester of first implementation**

**Module used in courses of study / semesters**

- Polymer Materials Science (MA120 LP) (Master) > Werkstofftechnik PolymerMaterialScMA120, Version of accreditation valid from WS 2014/15 > Pflichtmodule

**Responsible person for this module**

**Further responsible persons** Prof. Dr. Dariush Hinderberger, Prof. Dr. Beate Langer

**Prerequisites**

**Skills to be acquired in this module**

- Students will be prepared for independent research.
- The project work is their first independent research experience.
- The students will learn to give a scientific presentation.
- They will become familiar with modern research topics in the field of polymers.

**Module contents**

This module covers advanced topics of polymer science and engineering. The lecture Polymer Colloquium is a ring lecture with local and guest lecturer presenting up to date information on their field of interest. The project work is the first way to perform an independent research at university or industry.

Lectures:  
1. Polymer Colloquium / Ring Lecture

- Introduction to database and literature research (block lecture)
- Modern methods and developments in polymer chemistry, physics and engineering
- New material developments
- Latest research activities by leading guest lecturers
- Activities in the local research groups (ring lecture)
- Interdisciplinary topics from adjacent fields

Lab course:  
1. Lab course Project Work

- Participation in a research group at university or in industry
- Introduction to independent research
- Combining literature and experimental research
- Independent preparation of the research report
- Oral presentation of the results using PowerPoint

**Forms of instruction** Lecture (1 SWS)  
Practical training (10 SWS)  
Course

**Languages of instruction** German, English

**Duration (semesters)** 1 Semester Semester

**Module frequency** jedes Wintersemester

**Module capacity** unlimited

**Time of examination**

**Credit points** 15 CP

**Share on module final degree** Course 1: %; Course 2: %; Course 3: %.

**Share of module grade on the course of study's final grade** 1

## CHE.05561.04 - Polymer Physical Chemistry

CHE.05561.04

10 CP

<b>Module label</b>	Polymer Physical Chemistry
<b>Module code</b>	CHE.05561.04
<b>Semester of first implementation</b>	
<b>Module used in courses of study / semesters</b>	<ul style="list-style-type: none"> <li>• Polymer Materials Science (MA120 LP) (Master) &gt; Werkstofftechnik PolymerMaterialScMA120, Version of accreditation valid from WS 2014/15 &gt; Pflichtmodule</li> </ul>
<b>Responsible person for this module</b>	
<b>Further responsible persons</b>	Prof. Dr. Dariush Hinderberger
<b>Prerequisites</b>	
<b>Skills to be acquired in this module</b>	<ul style="list-style-type: none"> <li>• The students obtain basics of the physical chemistry of polymers and their characterization methods.</li> <li>• The overview of analytical techniques for polymers enables the students for their practical application.</li> <li>• They learn to perform basic polymer analyses using different techniques.</li> <li>• Finally, they improve their capabilities in writing of scientific reports.</li> </ul>

<b>Module contents</b>	<p>This module covers basic topics of polymer physical chemistry. The lectures Instrumental Analytics of Polymers, Physical Chemistry and Polymer Characterization give an overview over the broad spectrum of characterization methods from different approaches. The lab courses Instrumental Analytics of Polymers Lab and Polymer Characterization Lab accompany the lectures and show the examples of the different characterization methods.</p> <p>Lectures:</p> <ol style="list-style-type: none"> <li>1. Instrumental Analytics of Polymers <ul style="list-style-type: none"> <li>• Basic principles of analytical chemistry</li> <li>• Statistical treatment of analytical data</li> <li>• Special chromatographic techniques for the investigation of polymers and polymer additives</li> <li>• Principles and instrumental parameters in molecule spectroscopy (IR- and Raman spectroscopy)</li> <li>• Thermal analytical methods for the characterization of chemical and physical properties of polymers</li> </ul> </li> <li>2. Physical Chemistry <ul style="list-style-type: none"> <li>• Phenomenological thermodynamics: Gibbs free energy, enthalpy, chemical potentials</li> <li>• Chemical and phase equilibrium, thermodynamics of mixtures</li> <li>• Chemical kinetics</li> <li>• Basics of statistical thermodynamics</li> </ul> </li> <li>3. Polymer Characterization <ul style="list-style-type: none"> <li>• Determination of molecular masses and distributions</li> <li>• Thermodynamics of polymer solutions, colligative properties</li> <li>• Viscosity and diffusion</li> <li>• DSC, DMA, TMA</li> <li>• Principles of chromatography</li> <li>• Characterization of non-linear polymers</li> <li>• Microstructure analysis by NMR</li> <li>• Electrospray GC-MS, MALDI-TOF</li> <li>• End-group titration</li> </ul> </li> </ol> <p>Lab courses:</p> <ol style="list-style-type: none"> <li>1. Instrumental Analytics of Polymers Lab e.g. <ul style="list-style-type: none"> <li>• Extraction of additives and analysis of extracts and residual monomers by GC/MS</li> <li>• Elastomer characterization by TGA</li> </ul> </li> </ol>
------------------------	--

- Qualitative analysis of polymers and copolymers by FTIR spectroscopy (MIR or NIR)
- Mn of polymers by vapour pressure osmometry or membrane osmometry

## 2. Polymer Characterization Lab e.g.

- static light scattering
- Dynamic light scattering
- Wide-angle X-ray scattering
- CMC determination
- Gel permeation chromatography (GPC/SEC)
- End-group titration
- Intrinsic viscosity
- Solubility of polymers
- Mass spectrometry of polymers (ESI and MALDI TOF)

## PHY.05563.03 - Polymer Physics

PHY.05563.03 10 CP

**Module label** Polymer Physics

**Module code** PHY.05563.03

**Semester of first implementation**

**Module used in courses of study / semesters**

- Polymer Materials Science (MA120 LP) (Master) > Werkstofftechnik PolymerMaterialScMA120, Version of accreditation valid from WS 2014/15 > Pflichtmodule

**Responsible person for this module**

**Further responsible persons** Prof. Dr. Kay Saalwächter

**Prerequisites**

**Skills to be acquired in this module**

- The students become acquainted with the fundamental concepts of experimental polymer physics.
- They learn and apply the theoretical fundamentals and the experimental physical methods used to characterize and investigate polymer materials.
- They gain practical experience with basic methods in experimental polymer physics.
- They will understand the properties of polymer surfaces.
- They receive the knowledge on methods and technologies to modify and analyze polymer surfaces.

**Module contents**

This module covers basic topics of polymer physics. The lectures Introduction to Polymer Physics and Polymer Surface Science give an overview over the broad spectrum of physical aspects of polymeric samples. The lab course Polymer Physical Lab accompanies the lectures and show the examples of the different characterization methods.

Lectures:

1. Introduction to Polymer Physics

- Structure of single chains (ideal vs. real chains, scattering, semidilute solutions and melts)
- Mechanical properties of polymers (liquids vs. solids, rubber elasticity, viscoelasticity, relaxation processes in polymer melts, Debye relaxation, flow behavior, time-temperature superposition and glass transition)
- Molecular structure and weight distributions (chemical structure, architecture, polymerization processes, determination of structures and molecular weights)
- Microscopic models for polymer dynamics (viscosity and diffusion, Rouse model, entanglements and reptation)
- Thermodynamics of solutions and melts (dilute and semidilute solutions, Flory-Huggins theory, kinetics of phase separation, block copolymers, semicrystalline polymers)

2. Polymer Surface Science

- Surface vs. bulk
- Surface composition and ordering
- Dynamic surface processes (adsorption, desorption, diffusion)
- Surface tension
- Surface analysis (XPS, SIMS, SEM, AFM)
- Surface modification by deposition (wet processes, dry processes, CVD, PE-CVD, PVD), polymer film growth
- Surface modification and functionalization (wet and dry etching, grafting, plasma treatment)
- Polymer in lithography
- Technical applications for surface modification

Lab course:

1. Lab course Polymer Physical Lab e.g.

- Rheology/mechanical spectroscopy
- DSC
- Polarization microscopy

<b>Further responsible persons</b>	Prof. Dr. Kay Saalwächter
<b>Prerequisites</b>	
<b>Skills to be acquired in this module</b>	<ul style="list-style-type: none"> <li>• The students deepen their background knowledge in polymer physics.</li> <li>• They will be familiar with fundamental principles of soft-matter physics.</li> <li>• They gain experience in advanced concepts of experimental or theoretical polymer physics.</li> </ul>

### Module contents

This module covers advanced experimental and theoretical details of polymer physics. Beside basic lecture (Soft Condensed Matter Physics), the students can focus on either experimental (Polymer Structure and Morphology) or more theoretical approaches (Polymer Theory). The Lab courses Advanced Polymer Physics Lab and Polymer Structure and Morphology give the students the opportunity to perform their own characterization experiments.

Lectures:

#### 1. Soft Condensed Matter Physics

- Structure and dynamics of liquids (existence, pair correlation function, glass transition)
- Liquid crystals (classification, structure and defects in nematics, nematic-to-isotropic phase transition, elastic properties and Fredericks-transition)
- Surfactants: supramolecular structures and self-organization (micelles and membranes)
- Colloidal dispersions: heterogeneous systems (Brownian motion, forces between colloids, colloidal phase transitions)
- Polymers (conformations: ideal chains, rubber elasticity, introduction into semicrystalline polymers)

#### 2a. (either) Polymer Structure and Morphology

- Scattering techniques: basic principles & general aspects, primary scattering and interference, comparison x-rays and neutrons, radiation sources and detectors
- X-ray diffraction (WAXS): typical setups, diffraction by crystals, Bragg's law and Laue condition, Miller indices, Structure factor and lattice factor, scattering of amorphous materials and liquids
- Small-angle X-ray scattering (SAXS): typical setups, application to semi-crystalline and self-assembled polymers, Guinier law and application to disordered systems
- Imaging techniques: light microscopy, atomic force microscopy, electron microscopy techniques

#### 2b. (or) Polymer Theory

- Conformational statistics of polymers
- Flory-Huggins theory for solutions and blends
- Self-consistent field theory
- Random phase approximation
- Polymer networks
- Scaling theory of polymers
- Theories of polymer dynamics

## Lab courses:

## 1. Advanced Polymer Physics Lab

- Experiments using special techniques for physical structure details: Dielectric spectroscopy, low-field NMR, light microscopy, atomic force microscopy, X-ray scattering

## 2. (optional) Polymer Structure and Morphology

- Practical exercises in imaging techniques, X-ray experiments with 1- and 2-dim detectors, AFM investigations on thin films
- Practical exercises in imaging techniques

## PHY.05566.05 - Advanced Polymer Physics

PHY.05566.05

10 CP

<b>Module label</b>	Advanced Polymer Physics
<b>Module code</b>	PHY.05566.05
<b>Semester of first implementation</b>	
<b>Module used in courses of study / semesters</b>	<ul style="list-style-type: none"> <li>• Polymer Materials Science (MA120 LP) (Master) &gt; Werkstofftechnik PolymerMaterialScMA120, Version of accreditation valid from WS 2014/15 &gt; Polymer Physics</li> <li>• Polymer Materials Science (MA120 LP) (Master) &gt; Werkstofftechnik PolymerMaterialScMA120, Version of accreditation valid from WS 2014/15 &gt; Polymer Science *</li> </ul>
<b>Responsible person for this module</b>	
<b>Further responsible persons</b>	Prof. Dr. Kay Saalwächter
<b>Prerequisites</b>	
<b>Skills to be acquired in this module</b>	<ul style="list-style-type: none"> <li>• The students deepen their background knowledge in polymer physics.</li> <li>• They will be familiar with fundamental principles of soft-matter physics.</li> <li>• They gain experience in advanced concepts of experimental or theoretical polymer physics.</li> </ul>

### Module contents

This module covers advanced experimental and theoretical details of polymer physics. Beside basic lecture (Soft Condensed Matter Physics), the students can focus on either experimental (Polymer Structure and Morphology) or more theoretical approaches (Polymer Theory). The Lab courses Advanced Polymer Physics Lab and Polymer Structure and Morphology give the students the opportunity to perform their own characterization experiments.

Lectures:

#### 1. Soft Condensed Matter Physics

- Structure and dynamics of liquids (existence, pair correlation function, glass transition)
- Liquid crystals (classification, structure and defects in nematics, nematic-to-isotropic phase transition, elastic properties and Fredericks-transition)
- Surfactants: supramolecular structures and self-organization (micelles and membranes)
- Colloidal dispersions: heterogeneous systems (Brownian motion, forces between colloids, colloidal phase transitions)
- Polymers (conformations: ideal chains, rubber elasticity, introduction into semicrystalline polymers)

#### 2a. (either) Polymer Structure and Morphology

- Scattering techniques: basic principles & general aspects, primary scattering and interference, comparison x-rays and neutrons, radiation sources and detectors
- X-ray diffraction (WAXS): typical setups, diffraction by crystals, Bragg law and Laue condition, Miller indices, Structure factor and lattice factor, scattering of amorphous materials and liquids
- Small-angle X-ray scattering (SAXS): typical setups, application to semi-crystalline and self-assembled polymers, Guinier law and application to disordered systems
- Imaging techniques: light microscopy, atomic force microscopy, electron microscopy techniques

#### 2b. (or) Polymer Theory

- Conformational statistics of polymers
- Flory-Huggins theory for solutions and blends
- Self-consistent field theory
- Random phase approximation
- Polymer networks
- Scaling theory of polymers
- Theories of polymer dynamics

## Lab courses:

## 1. Advanced Polymer Physics Lab

- Experiments using special techniques for physical structure details: Dielectric spectroscopy, low-field NMR, light microscopy, atomic force microscopy, X-ray scattering

## 2. (optional) Polymer Structure and Morphology

- Practical exercises in imaging techniques, X-ray experiments with 1- and 2-dim detectors, AFM investigations on thin films
- Practical exercises in imaging techniques
